

TokTickIT — Lab 3 Submission Report

Release evidence for authenticated requester, IT staff, administrator, testing, review, and delivery work.

Repository: [TokTickIT-Individual-Sprints](#)
Pull request: [PR #43](#) lab3-staging → main
Implementation commit: [f4be28a](#)
Evidence commit: generated with this report

Evidence boundary. Browser captures are deterministic Playwright API-fixture captures. They document the submitted UI states and are not presented as live production records. API authorization and workflow claims are backed by the server test suite.

Verification: server 14 files / 45 tests, client 8 files / 20 tests, 2 Playwright tests, and both production builds passed.

Answer Part 1 — Scope and engineering contract

- Bearer-session authentication, password-change gate, logout, and safe inactive-user handling.
- Requester ticket list, validated atomic creation, detail, attachments, public comments, and appears-resolved workflow.
- IT staff queue/detail, search and status filtering, atomic claim, workflow transitions, public comments, and internal notes.
- Administrator user listing, account creation, role editing, deactivation guards, and duplicate-email handling.
- API, component, authenticated E2E, responsive, documentation, and GitHub review evidence.

Verification commands

```
cd server && npm test && npm run build
cd client && npm test && npm run build
cd client && npm run test:e2e
```

See `artifacts/lab-03/EVIDENCE.md` and `docs/lab-03/tests.md` for the traceability details.

Answer Part 2 — Architecture, migration, and seed data

The migration preserves Lab 2 records and links seeded Requesters to authentication Users. Passwords use independent salts, and the idempotent seed includes sample tickets, public comments, and internal notes without exposing hashes.

Answer Part 3 — Authentication and authorization

Bearer sessions, first-login password change, server-derived requester ownership, role checks, safe errors, and administrator safeguards are covered by the API contract and tests.

Answer Part 4 — Requester workflow

Authenticated Requesters can create tickets with an optional creation attachment, view owned details, manage attachments, add public comments, and report that a problem appears resolved.

Answer Part 5 — Authenticated requester and responsive captures

Requester screen at 375px mobile width.

These captures were generated by `client/e2e/lab-03/authenticated-requester.spec.ts` after the test assertions passed.

Answer Part 6 — IT Staff queue and ticket workflow

Staff can search, filter, sort, paginate, claim, reassign, prioritize, transition, comment, and add internal notes through role-protected APIs and UI controls.

Answer Part 7 — Administrator user management

Administrators can search, edit, create, reactivate, deactivate, change roles, and reset initial passwords while self-deactivation and final-administrator safeguards remain enforced.

Answer Part 8 — Automated verification and responsive evidence

Server and client unit/API tests, authenticated E2E coverage, production builds, and 1440px/768px/375px captures verify the release candidate.

Answer Part 9 — Review and delivery record

[Author response to requested changes](#) records the implementation and verification results. The collaborator review remains pending re-review; this report does not claim approval or merge.

The release evidence files include the AI-use disclosure, review trail, test traceability, screenshots, and this PDF. The source remains on lab3-staging until the collaborator completes review and merges PR #43.
